

# Mars Dust Inc.

By Jelínek Matyáš, Anna Bubenickova, Laura Kotaskova  
Sofia Guzma-Khan, and Radovan Mihalik

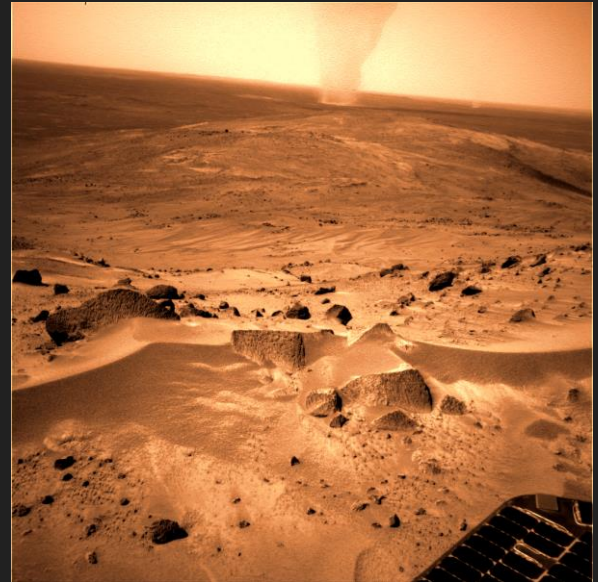

# 1. What kind of business do we want to set up on mars?

We want to do business selling martian soil from Mars, because the price of Mars Dust is high and scientists need it for experiments. Also it is radioactive so maybe scientists will find a way to use that radiation; when this happens the price will increase even more.

## 2. Would you provide products and services?

We will send robots to go to mars and the robots will collect the dust. They will then return to the orbital station. This repeats on and on, until we come there every two years and we will carry all the mars dust to earth, which we will then sell to researchers and other people for a lot of money.

### 3. Who would be your suppliers?

We will send robots to collect dust, and when they're full, they will go to the orbital station we have set up. Then we take the dust to earth every 2 years, and we will sell it all.

## 4. What difficulties must you overcome?

I think that the most difficult part will be taking the dust off mars and bringing it back to earth, because we would be able to travel there every two years where we will get enough dust but i also think it will be difficult to control everything for two years.

INC.

## 6. What is your motivation?

Mars dust inc. was made for scientists to do research about Martians. If you buy this product you will have access to do research. Of Course you can do anything else with it but the idea of Mars Dust inc. is for research. It is very rare because we can only send a spaceship every two years because Earth spins around the sun faster than Mars and every two years they meet.

# The End.

Thank you for your attention.
